

Mode-by-mode test of the Anderson $\leftrightarrow$ R^2_{spec} bridge

Mode-by-mode bridge: IPR vs demand-projection
pooled $n=6923$ $\rho=-0.300$ ($p=2.3e-144$) low-freq $\rho=-0.175$ ($p=3e-25$)

Extended vs localized modes (within frequency bands)
Anderson hypothesis: green > red across all bands
